

# **Decision Tree**

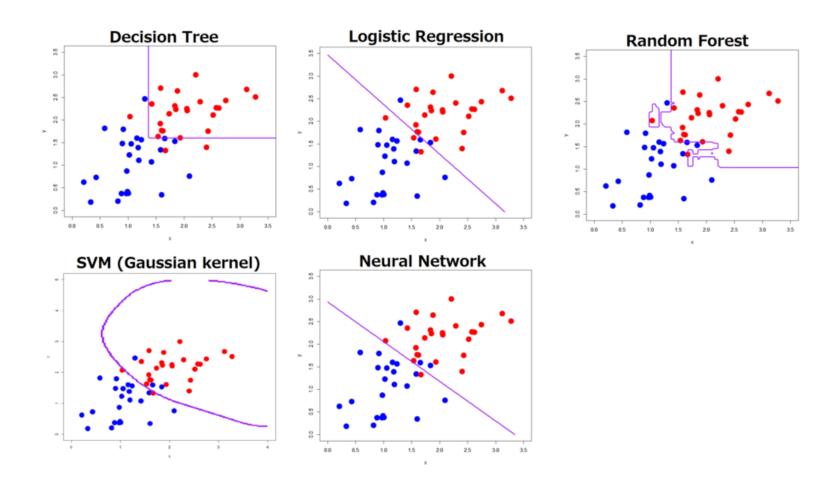

Pilsung Kang
School of Industrial Management Engineering
Korea University

# AGENDA

- 01 Classification Tree
- 02 Regression Tree

# Why Are There So Many Classifiers?

• We cannot guarantee that a single classifier is always better than the others

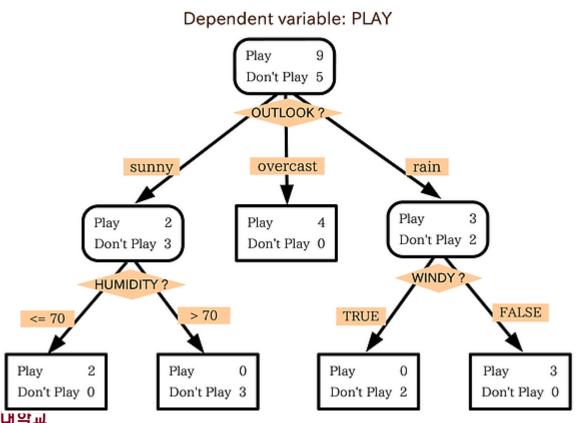

#### Goal

- ✓ Classify or predict an outcome based on a set of predictors.
- ✓ The output is a set of rules.

#### Rule example

If outlook is sunny and if humidity > 70 then he does not play

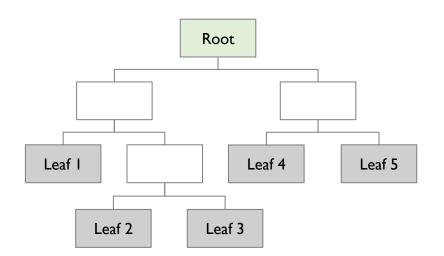

or

If outlook is rainy and it is not windy then he does play

#### Terminologies

- ✓ Parent node: node before split
- ✓ Child node: node after split
- ✓ Split criterion: a certain variable value used for split a node
- ✓ Root node: node that only has child nodes but no parent node
- ✓ Leaf nodes: nodes that only have a parent node but no child nodes

#### Why CART?

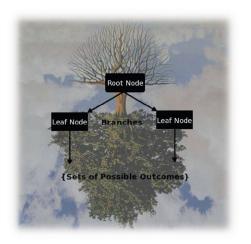

- ✓ Simple to understand and interpret.
- √ Requires little data preparation (normalization, missing value treatments, etc.)
- ✓ Able to handle both numerical and categorical data.

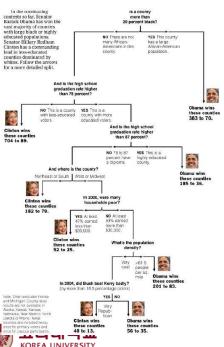

#### Key Ideas

- ✓ <u>Recursive Partitioning</u>
  - Repeatedly split the records into two parts so as to achieve maximum homogeneity within the new parts.
- ✓ Pruning the Tree
  - Simplify the tree by pruning peripheral branches to avoid over-fitting.

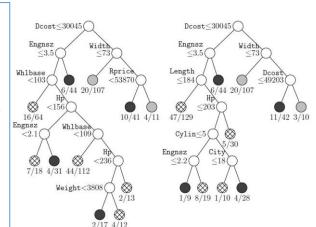

#### Classification and Regression Tree (CART)

- Generate a set of rules by recursively partitioning the entire datasets to increase the purity of the partitioned area (Breiman, 1984)
- Being able to explain the reason of the prediction result by following the rules to the target leaf node
- Can handle categorical and numerical variables simultaneously

#### Recursive Partitioning

- Partition the data in a parent node into two child nodes using a certain value of a certain variable
- Select the split point to maximize the purity of the child nodes
- Gini-index (for categorical variable) and the variance (for numerical variable) are used to measure the impurity of a node

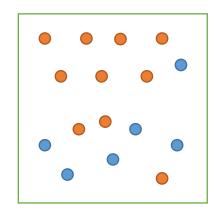

- Measuring Impurity 1: Gini Index
  - ✓ Gini Index for rectangle A containing m records

$$I(A) = 1 - \sum_{k=1}^{m} p_k^2$$

p = proportion of cases in rectangle A that belong to class k.

proportion of cases in rectangle A that belong to class k. 
$$I(A) = 1 - \sum_{k=1}^{m} p_k^2$$

$$= 1 - \left(\frac{6}{16}\right)^2 - \left(\frac{10}{16}\right)^2$$

$$\approx 0.47$$

- I(A) = 0 when all cases belong to the same class.
- Max value when all classes are equal represented (=0.5 in binary case)

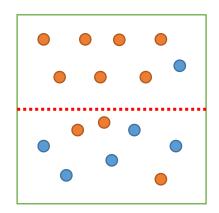

- Measuring Impurity I: Gini Index
  - ✓ When their more than two rectangles

$$I(A) = \sum_{i=1}^{d} \left( R_i \left( 1 - \sum_{k=1}^{m} p_{ik}^2 \right) \right)$$

•  $R_i$  = proportion of cases in rectangle Ri among the training data.

$$= 0.5 \times \left(1 - \left(\frac{7}{8}\right)^2 - \left(\frac{1}{8}\right)^2\right) + 0.5 \times \left(1 - \left(\frac{3}{8}\right)^2 - \left(\frac{5}{8}\right)^2\right)$$

$$=0.34$$

"Information gain" after splitting: 0.47-0.34=0.13

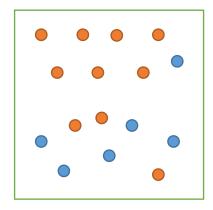

Measuring Impurity 2: Deviance

$$D_i = -2\sum_k n_{ik}log(p_{ik})$$

 $\checkmark$  i: node index, k: class index,  $p_{ik}$ : probability of class k in node I

$$D_{i} = -2 \times \left(10 \times log\left(\frac{10}{16}\right) + 6 \times log\left(\frac{6}{16}\right)\right)$$

$$= 21.17$$

 $\checkmark$  Deviance = 0 if and only if all nodes contain instances from the same class

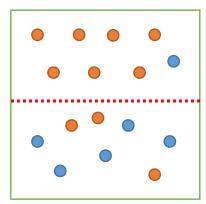

Measuring Impurity 2: Deviance

$$D_i = -2\sum_k n_{ik}log(p_{ik})$$

 $\checkmark$  i: node index, k: class index,  $p_{ik}$ : probability of class k in node I

$$D_1 = -2 \times \left(7 \times log\left(\frac{7}{8}\right) + 1 \times log\left(\frac{1}{8}\right)\right) = 6.03$$

$$D_2 = -2 \times \left(3 \times log\left(\frac{3}{8}\right) + 5 \times log\left(\frac{5}{8}\right)\right) = 10.59$$

$$D_1 + D_2 = 16.62$$

✓ Information gain = 21.17 – 16.62 = 4.55

• Example: Riding Mowers

√ Goal: Classify 24 households as owning or not owning riding mowers

✓ Predictors: Income, Lot size

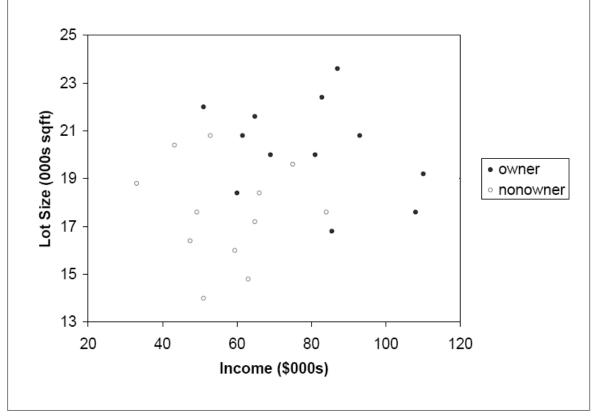

Income	Lot size	Ownership	Income	Lot size	Ownership
60.0	18.4	Owner	75.0	19.6	Non-owner
85.5	16.8	Owner	52.8	20.8	Non-owner
64.8	21.6	Owner	64.8	17.2	Non-owner
61.5	20.8	Owner	43.2	20.4	Non-owner
87.0	23.6	Owner	84.0	17.6	Non-owner
110.1	19.2	Owner	49.2	17.6	Non-owner
108.0	17.6	Owner	59.4	16.0	Non-owner
82.8	22.4	Owner	66.0	18.4	Non-owner
69.0	20.0	Owner	47.4	16.4	Non-owner
93.0	20.8	Owner	33.0	18.8	Non-owner
51.0	22.0	Owner	51.0	14.0	Non-owner
81.0	20.0	Owner	63.0	14.8	Non-owner

Order records according to one variable

Order the data with regard to <u>lot size</u>

Ownership	Lot size	Income
Non-owner	14.0	51.0
Non-owner	14.8	63.0
Non-owner	16.0	59.4
Non-owner	16.4	47.4
Owner	16.8	85.5
Non-owner	17.2	64.8
Owner	17.6	108.0
Non-owner	17.6	84.0
Non-owner	17.6	49.2
Owner	18.4	60.0
Non-owner	18.4	66.0
Non-owner	18.8	33.0
Owner	19.2	110.1
Non-owner	19.6	75.0
Owner	20.0	69.0
Owner	20.0	81.0
Non-owner	20.4	43.2
Owner	20.8	61.5
Owner	20.8	93.0
Non-owner	20.8	52.8
Owner	21.6	64.8
Owner	22.0	51.0
Owner	22.4	82.8
Owner	23.6	87.0

#### Find midpoints between successive values

- First midpoint = 14.4 (0.5\*(14.0+14.8))
- Divide records into those with Lot size > 14.4 and those < 14.4</li>
- Compute the impurity: Gini index
  - ✓ Before splitting:

$$1 - \left(\frac{12}{24}\right)^2 - \left(\frac{12}{24}\right)^2 = 0.5$$

✓ After splitting:

$$\frac{1}{24} \left( 1 - \left( \frac{1}{1} \right)^2 \right) + \frac{23}{24} \left( 1 - \left( \frac{12}{23} \right)^2 - \left( \frac{11}{23} \right)^2 \right) \approx 0.48$$

✓ Information gain: 0.50-0.48=0.02

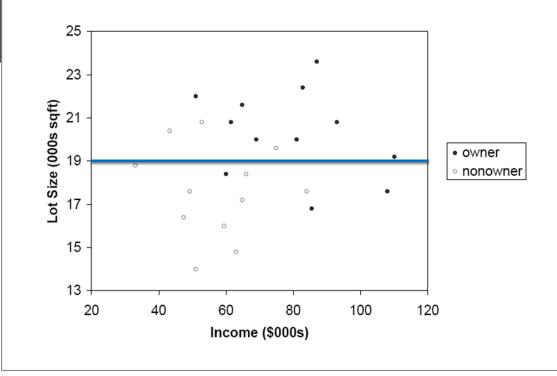

Income	Lot size	Ownership
51.0	14.0	Non-owner
63.0	14.8	Non-owner
59.4	16.0	Non-owner
47.4	16.4	Non-owner
85.5	16.8	Owner
64.8	17.2	Non-owner
108.0	17.6	Owner
84.0	17.6	Non-owner
49.2	17.6	Non-owner
60.0	18.4	Owner
66.0	18.4	Non-owner
33.0	18.8	Non-owner
110.1	19.2	Owner
75.0	19.6	Non-owner
69.0	20.0	Owner
81.0	20.0	Owner
43.2	20.4	Non-owner
61.5	20.8	Owner
93.0	20.8	Owner
52.8	20.8	Non-owner
64.8	21.6	Owner
51.0	22.0	Owner
82.8	22.4	Owner
87.0	23.6	Owner

#### Find the best split

 Find the best split which maximize the (Gini or information gain)

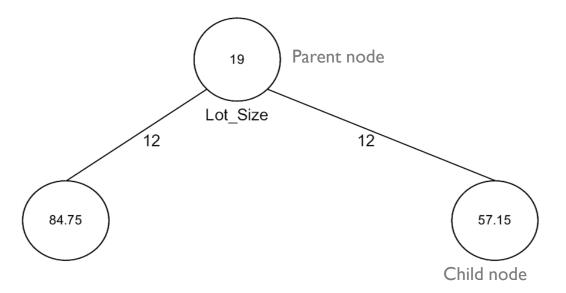

Income	Lot size	Ownership
51.0	14.0	Non-owner
63.0	14.8	Non-owner
59.4	16.0	Non-owner
47.4	16.4	Non-owner
85.5	16.8	Owner
64.8	17.2	Non-owner
108.0	17.6	Owner
84.0	17.6	Non-owner
49.2	17.6	Non-owner
60.0	18.4	Owner
66.0	18.4	Non-owner
33.0	18.8	Non-owner
110.1	19.2	Owner
75.0	19.6	Non-owner
69.0	20.0	Owner
81.0	20.0	Owner
43.2	20.4	Non-owner
61.5	20.8	Owner
93.0	20.8	Owner
52.8	20.8	Non-owner
64.8	21.6	Owner
51.0	22.0	Owner
82.8	22.4	Owner
87.0	23.6	Owner

#### Tree structure

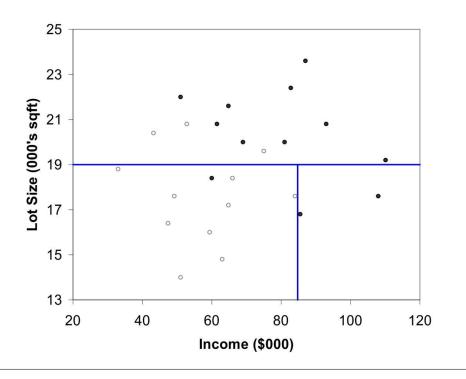

- Split point become nodes on tree (circles with split value in center)
- Rectangles represent "leaves" (terminal points, no future splits, classification value noted)
- Numbers on lines between nodes indicate # cases.

Income	Lot size	Ownership
51.0	14.0	Non-owner
63.0	14.8	Non-owner
59.4	16.0	Non-owner
47.4	16.4	Non-owner
85.5	16.8	Owner
64.8	17.2	Non-owner
108.0	17.6	Owner
84.0	17.6	Non-owner
49.2	17.6	Non-owner
60.0	18.4	Owner
66.0	18.4	Non-owner
33.0	18.8	Non-owner
110.1	19.2	Owner
75.0	19.6	Non-owner
69.0	20.0	Owner
81.0	20.0	Owner
43.2	20.4	Non-owner
61.5	20.8	Owner
93.0	20.8	Owner
52.8	20.8	Non-owner
64.8	21.6	Owner
51.0	22.0	Owner
82.8	22.4	Owner
87.0	23.6	Owner

- Repeat the splitting until there is no gain.
- E.g., second split = income = 84.75

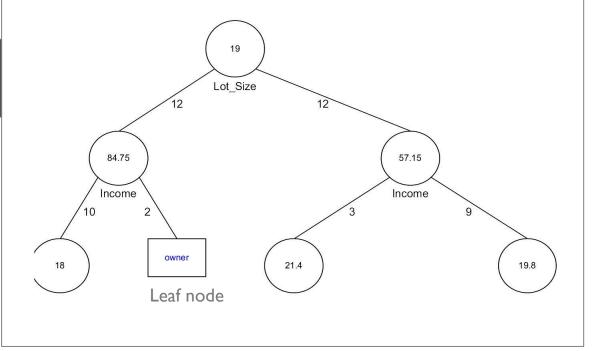

Lot size	Ownership
18.8	Non-owner
16.4	Non-owner
17.6	Non-owner
14.0	Non-owner
16.0	Non-owner
18.4	Owner
14.8	Non-owner
17.2	Non-owner
18.4	Non-owner
17.6	Non-owner
16.8	Owner
17.6	Owner
	18.8 16.4 17.6 14.0 16.0 18.4 14.8 17.2 18.4 17.6 16.8

- Repeat the splitting until there is no gain.
- E.g., second split = income = 84.75

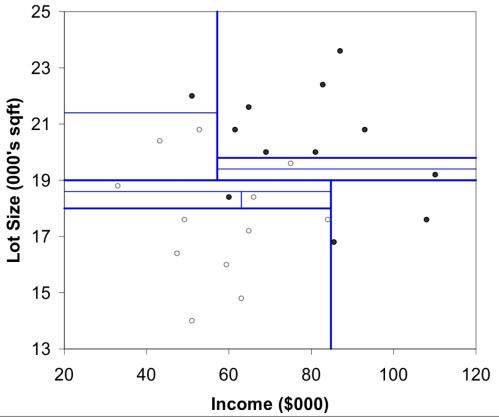

Income	Lot size	Ownership
33.0	18.8	Non-owner
47.4	16.4	Non-owner
49.2	17.6	Non-owner
51.0	14.0	Non-owner
59.4	16.0	Non-owner
60.0	18.4	Owner
63.0	14.8	Non-owner
64.8	17.2	Non-owner
66.0	18.4	Non-owner
84.0	17.6	Non-owner
85.5	16.8	Owner
108.0	17.6	Owner

- Repeat the splitting until there is no gain.
- Final splitting

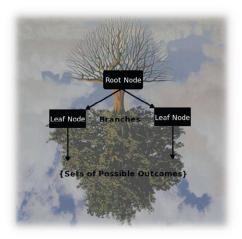

- Each leaf node label is determined by "voting" of the records within it, and by the cutoff value.
- Records within each leaf node are from the training data.
- Default cutoff=0.5 means that the leaf node's label is the majority class.
- Cutoff = 0.75 requires majority of 75% of more "I" records in the leaf to label it a "I" node.

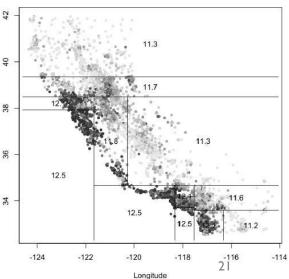

# The the manifestaling contents to far. Senator Barrier was majority of counties and an account of the senator barrier was majority of counties and the senator barrier was formed and the senator barrier was formed

#### Classification and Regression Tree (CART)

- Generate a set of rules by recursively partitioning the entire datasets to increase the purity of the partitioned area (Breiman, 1984)
- Being able to explain the reason of the prediction result by following the rules to the target leaf node
- Can handle categorical and numerical variables simultaneously

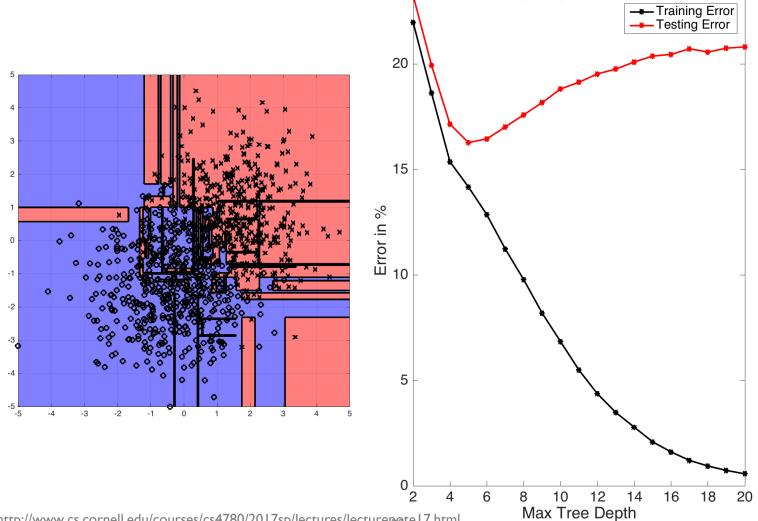

#### Pruning

- Aggregate some child node into a parent node to avoid over-fitting
- Pre-pruning: pruning is done during the tree construction
- Post-pruning: Once a full-tree is constructed, nodes are pruned by taking the validation error and tree complexity

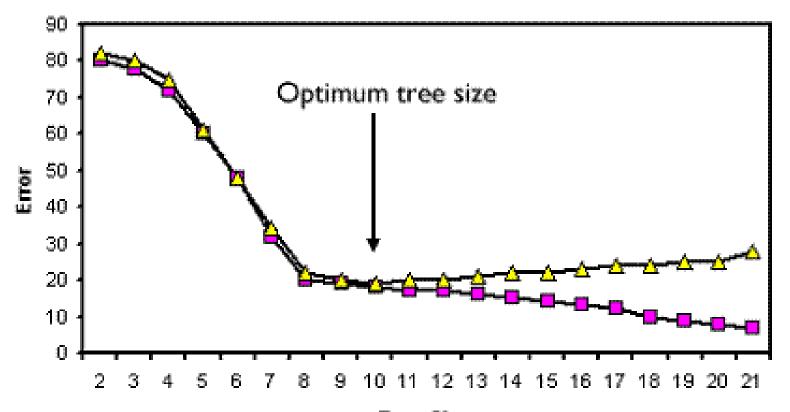

• Recursive partitioning is completed when every leaf node has 100% purity

- Full tree which is a result of recursive partitioning has a risk of overfitting, which in turn, results in poor generalization ability
  - ✓ It tends to memorize the training dataset, rather than discovering significant patterns

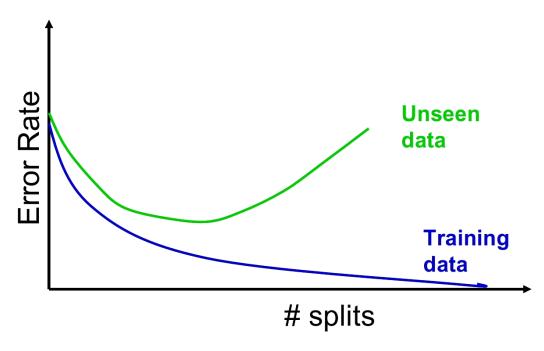

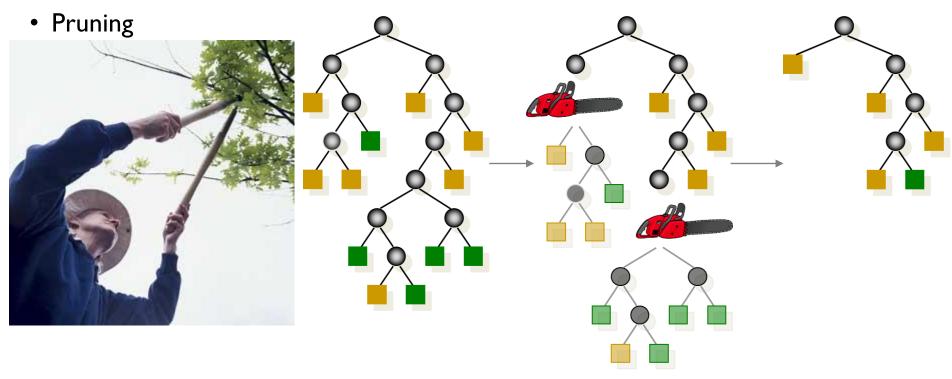

#### Overfitting problem

- √ The end of recursive partitioning process is 100% purity in each leaf
- ✓ It over-fits the data, ending up fitting noise in the data and leading to low predictive accuracy of new data
- ✓ Past a certain point, the error rate for the validation data starts to increase

- ✓ CART lets tree grow to full extent, then prunes it back.
- ✓ Idea is to find that point at which the validation error begins to rise.
- √ Generate successively smaller trees by pruning leaves.
- ✓ At each pruning stage, multiple trees are possible.

wse "cost complexity" to choose the best tree at that stage.

Cost complexity

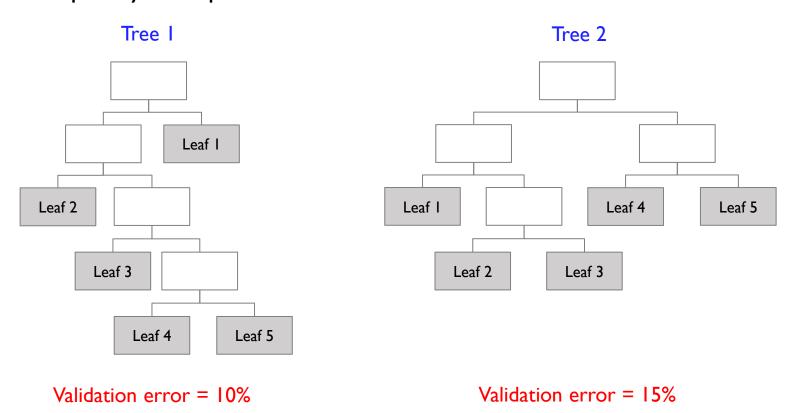

$$CC(T) = Err(T) + \alpha \times L(T)$$

- $\checkmark$  CC(T) = cost complexity of a tree
- $\checkmark$  ERR(T) = proportion of misclassified records in the validation data
- ✓ Alpha = penalty factor attached to the tree size (set by the user)

Cost Complexity Example 1

 Two trees have the same number of leaf nodes but Tree I yields lower validation error → Tree I should be preferred

Cost Complexity Example 2

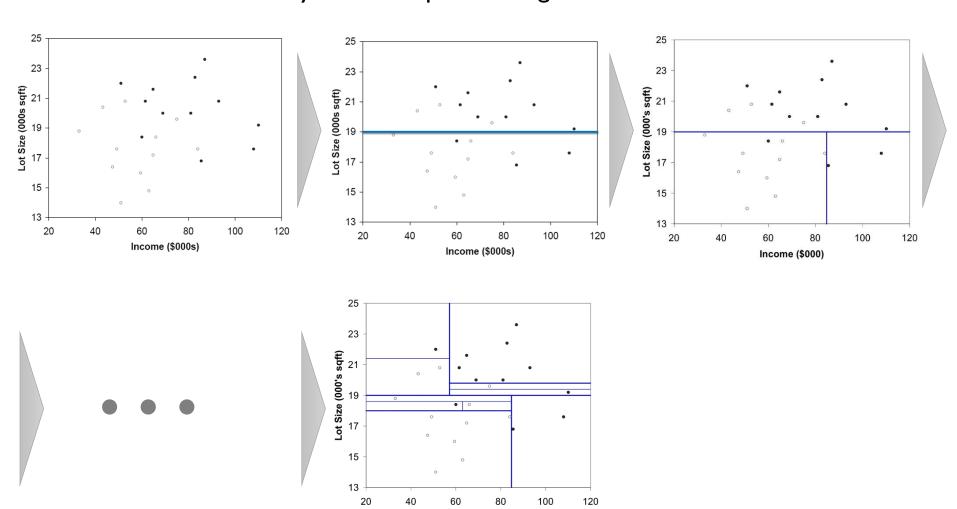

√ Two trees yield the same validation error, but Tree A has fewer leaf nodes (simpler tree structure) → Tree A should be preferred

• Full tree constructed by recursive partitioning

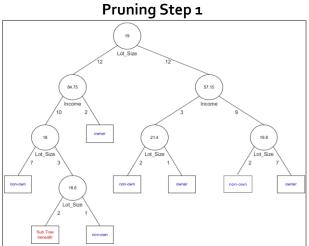

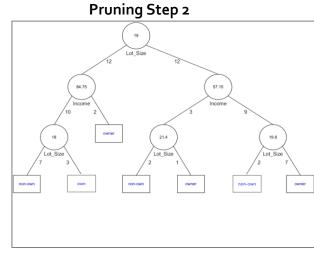

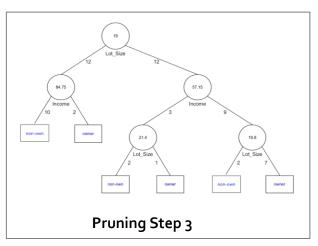

Income (\$000)

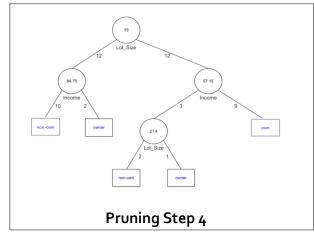

#### Pruning

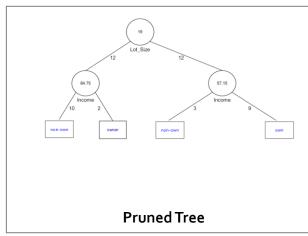

# Full Tree 19 Lot. Size 12 12 57.15 Income 10 2 18 19.8

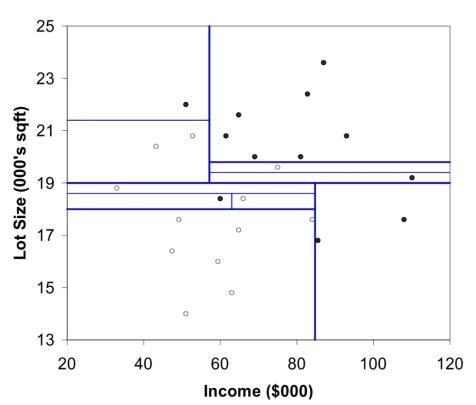

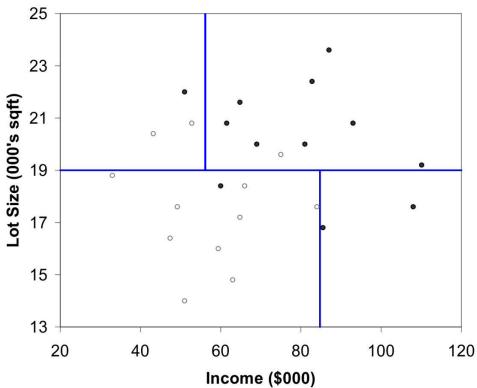

• Full tree vs. Pruned tree

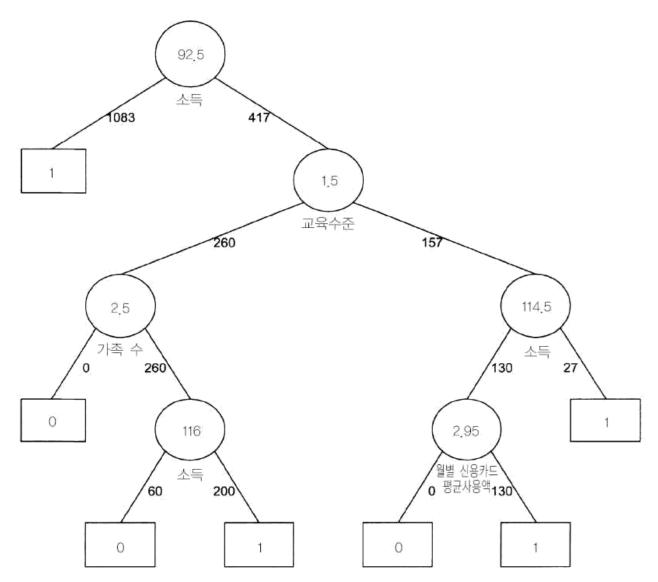

- Example: Universal bank
  - ✓ Goal: to analyze what combination of factors make a customer more likely to accept
    a personal loan

Generating the rules from the pruned tree

- IF(Lot size < 19) AND IF(Income < 84.75) THEN Owner = No
- IF(Lot size < 19) AND IF(Income > 84.75) THEN Owner = YES
- IF(Lot size > 19) AND IF(Income < 57.15) THEN Owner = NO
- IF(Lot size > 19) AND IF(Income > 57.15) THEN Owner = YES

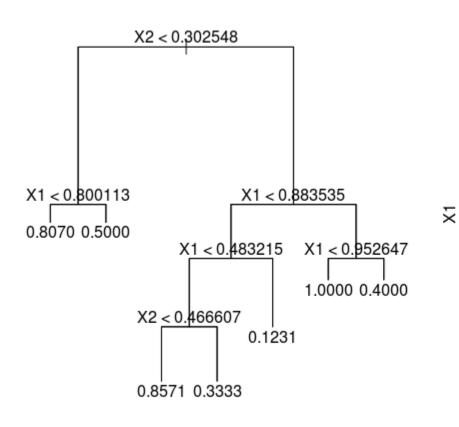

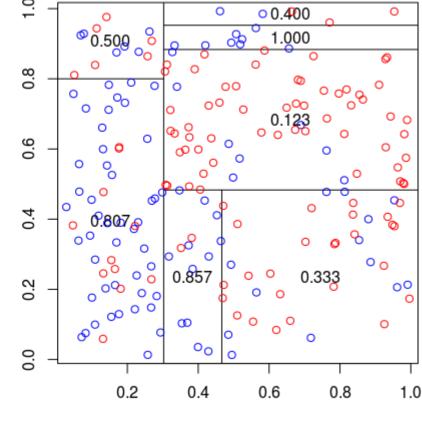

# AGENDA

- 01 Classification Tree
- 02 Regression Tree

- The output of a leaf (terminal) node
  - ✓ The average of the target values of the observations in the node

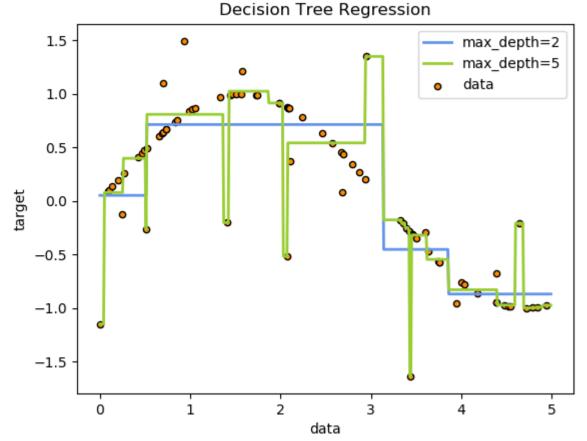

X2

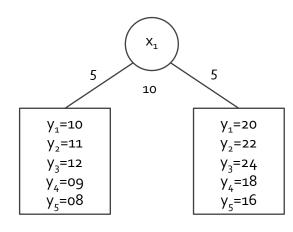

- The output of a leaf (terminal) node
  - √ The average of the target values of the observations in the node
  - √ Regression tree example

#### Similar process with classification tree except

- Prediction of the node
  - √ The average of the outcome variables belonging to the node.

- Predicted value of the left leaf node = 10
- Predicted value of the right leaf node = 20

- Impurity
  - ✓ Sum of squared error (SSE:  $\sum_{i=1}^{n} (y_i \hat{y})^2$ )
  - $\checkmark$  SSE(Parent) = 300, SSE(Left) = 10, SSE(Right) = 40, Gain = 250

• Predict the selling price of Toyota corolla

Dependent variable (target)

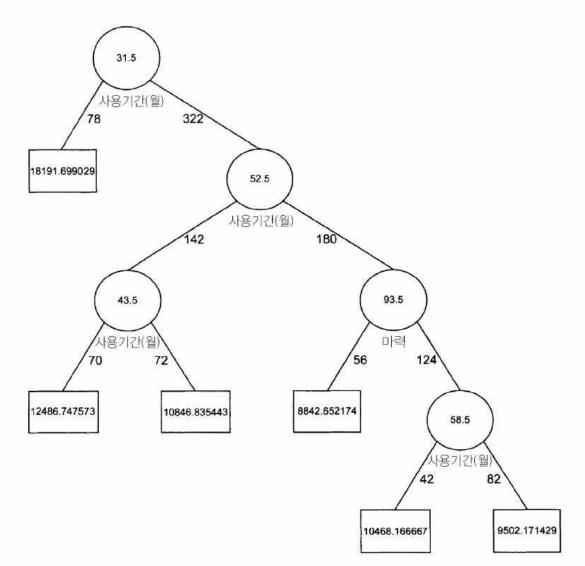

Independent variables (attributes, features)

Variable	Description
Price	Offer Price in EUROs
Age_08_04	Age in months as in August 2004
KM	Accumulated Kilometers on odometer
Fuel_Type	Fuel Type (Petrol, Diesel, CNG)
HP	Horse Power
Met_Color	Metallic Color? (Yes=1, No=0)
Automatic	Automatic ( (Yes=1, No=0)
CC	Cylinder Volume in cubic centimeters
Doors	Number of doors
Quarterly_Tax	Quarterly road tax in EUROs
Weight	Weight in Kilograms

#### • Pruned Tree

# **CART:** Summary

#### Advantages

- √ Classification and regression tree (CART) is easy to use and understand
- ✓ Produce rules that are easy to interpret & implement
- √ Variable selection & reduction is automatic.
- ✓ Do not require the assumptions of statistical models
- ✓ Can work without extensive handling of missing data

#### Disadvantages

- ✓ May not perform well where there is structure in the data that is not well captured
  by horizontal or vertical split
- ✓ Since the process deals with "one variable at a time", no way to capture interactions between variables

# **CART:** Summary
